
CG PE C240
AA iPP
filled: long hold, 176–300 ns, CG only (chains moved ≥ own size)
UA PE
CG PE C1500
small open: 5 ns sweep step
AA PE
black: experiment (circle PE, square iPP)
diamond: 500 K melt
UA iPP
open: sweep hold (chains inherited from 500 K)
line: joins the sweep points (dashed: C1500)
(a) End-to-end distance
$R_{ee} = \langle R^2_{ee} \rangle^{1/2}$ (Å)
T (°C)
(b) C240 vs C1500: $\langle R^2_{ee} \rangle / M$
$\langle R^2_{ee} \rangle$ / M (Å^2 mol g^{-1})
PE melt expt.
T (°C)
(c) Ordered-site fraction vs T
CG PE C240 5 nm pore film (40 chains)
CG PE C240 5 nm pore film (320 chains)
fraction of sites with p2 ≥ 0.4
uncalibrated threshold: a melt baseline, not crystallinity
T (°C)
